AUTOMATION TESTING PROCESS:

Business Challenge:

- While testing domain expertise require to understand the application.
- In logistics domain date played an important role in the test data. But there was issue while passing the date as input to the application
- Products are not delivered during weekends and federal holidays, test data (date) which is given as input needs to be changed manually each time before the execution of test cases.
- Generated quote will get expired in 2 days after the move, to run the script each time the quote reference number needs to be updated.
- Failure of existing scripts.
- Modal / Confirmation pop up were added to the application.

Solution:

- New Functions were created to convert the date into correct format and the application accepts the implemented format.
- New functions with SQL queries were generated and based on the input (Date) it automatically checks whether the day falls on weekends or federal holidays, then queries allows to pick up the working days.

- Instead of using the expired reference number of the quote, generated new functionality gets the latest quote number that can be used in the application.
- Removed the unnecessary actions according to the analyzed framework and application, changes were made in the framework for successful execution of scripts.
- Recovery scenarios were created to overcome the new model and also confirmation pop up's which were included in the design.
